1. What corrections did you have to make, and how did you make them?

The first major correction I had to make was making captions for all of the images that described what was in them. To do this, I added alt tags with detailed descriptions of the picture to all of the img tags. The second correction I had to make was captioning all of the buttons, which I did by adding aria-label tags to all of the buttons that described their functionality.

2. Is this interface functional without the use of a mouse (i.e., just using keyboard keys)? Why or why not?

Yes, it is functional without a mouse because you can navigate through the site using the tab button to move forward, tab and shift to move backgrounds, and enter to select.

3. What are other accessibility tests or features you added or would be interested in learning about?

It would be interesting to learn about how screen readers would convey to users that when they click albums they are taken to another platform (Spotify). In other words, how does the screen reader dictate that the users are being taken to a different screen based on their selection?
